

DAY 2 — TASK 2

UNDERSTANDING AND IMPLEMENTING METHODS & SELF CLEARLY

Understand how multiple instance methods work together, how self behaves internally, and build your confidence to use methods logically.

✓ Assigned Task 2

◆ Theoretical Concepts You Must Learn Today:

1. What are **instance methods** in a class?
 2. What is self and how does it refer to the **current object**?
 3. How are **multiple methods** used in one class?
 4. How can **one method call another** within the same class?
-

◆ Practical Coding Task:

➤ Scenario:

You're building a simple **calculator class**. This calculator can **add**, **subtract**, **multiply**, and **divide** two numbers. You'll use separate methods for each operation, and then a method to display all results together.

▪ Task Requirements:

1. Create a class named Calculator.
 2. Use `__init__()` to take two numbers: **num1** and **num2**.
 3. Add the following methods:
 - **add()**
 - **subtract()**
 - **multiply()**
 - **divide()** (add check: division by zero)
 4. Add a method **show_all()** that:
 - Calls all the above methods
 - Prints results in this format:
 5. Create one object with numbers of your choice (e.g., 10 and 2), and call `show_all()`.
-

➔ **Bonus Twist (Optional but Rewarding):**

- Create a second object with **different values** and test again.
 - Try to take input from the user using **input()** (optional).
-

❖ **Bonus Tips:**

- Use f"" formatting for clean output.
 - Keep your code **readable and neat**.
 - Try to write short comments above each method (helps you in viva).
-

 Deadline:

Submit by: *Tomorrow before 11:59 PM*

Day: 2 of 8

You are on track. Stay consistent, and you'll dominate Python OOP in 8 days ⌚....

 Final :

After completing, reply with:

“ Task 2 Completed. “

Then I'll review....
