

Understanding Agentic AI

1. Introduction to Agentic AI

Agentic AI, in simple terms, is a type of smart software that does not just follow your orders but can think, plan, and take action independently to achieve a big goal. Unlike traditional AI that only responds to specific instructions, Agentic AI can decide the steps it needs to take to reach the final objective without requiring constant guidance.

For example, if you tell Agentic AI to write and publish a blog on productivity, it will research the topic, create an outline, write the blog with proper grammar, add relevant images, and even publish it - all without you telling it each step.

This is different from Generative AI, which will only do exactly what you ask. If you tell Generative AI to write a blog, it will just write it. If you want grammar corrections or image additions, you have to instruct it step-by-step.

2. Difference Between Generative AI and Agentic AI

Generative AI:

- Creates new content (text, images, videos, code, audio) based only on your prompts.
- Follows instructions exactly, without adding extra steps.
- Example: If asked to write a blog on productivity, it will only write the blog. If you want grammar checks or images, you must ask separately.

Agentic AI:

- Goal-oriented and works towards completing the entire task.
 - Can break a big goal into smaller steps, complete each step, and deliver the final output.
 - Example: If asked to write and publish a blog on productivity, it will research, write, grammar check, add images, and publish automatically.
-

3. Future of Agentic AI

Agentic AI is still in its early stages but has a very bright future. It can transform the way we work by acting as our personal assistant, research assistant, or even creative partner.

Unlike AI that only provides ideas, Agentic AI will also help implement those ideas.

In the future, most AI systems will move towards being Agentic - not just intelligent but also autonomous and proactive in achieving goals.

4. Conclusion

In summary, Generative AI creates content based on specific prompts, while Agentic AI works independently to achieve a given goal. The key difference is that Generative AI stops after completing the exact instruction, but Agentic AI continues until the overall objective is met.

Understanding this difference is crucial as Agentic AI becomes more common in our daily lives, helping us save time, improve productivity, and achieve complex goals with minimal guidance.

Note: I have made every effort to explain this to you in simple wording.

If you find it difficult to understand in English, you can provide the entire PDF, a specific line, or even a single word to ChatGPT and get it translated into Urdu or any other language to understand it more clearly.

Insha'Allah, in the next PDF, I will cover the complete Agentic AI syllabus step-by-step in simple terms. For example, Step 00 – Swarm, Step 01 – UV, and so on, until the entire syllabus is explained, preparing you for both Level 1 and Level 2 of the Agentic AI test.
